| S.No: 7 | Exp. Name: ***Creating and Nesting Function and Class Components*** | **Date: 2026-09-30** |
|---|---|---|

**Aim:**

You are developing a React application for a digital library. The application should display information about a book by creating and nesting React components. In this activity, the React application setup has already been provided. Your task is to create the **Book** function component and the **App** class component and nest the **Book** component inside the **App** component.

# Your Task

1. Inside **Book.jsx**, create a function component named **Book** that returns a `<div>` with the class **book-card**, containing:
   - An `<h2>` element with the text "The Great Gatsby".
   - A paragraph element with the text "Author: F. Scott Fitzgerald".

Export the **Book** component.

2. In the **App.jsx** file:
   - Create a class component named **App** that extends **Component**.
   - Import the `Book` component from `./Book`.
   - Inside the `render()` method, display an `<h3>` element with the text "Books".
   - Create a `<div>` with the class name **library**, and nest the `<Book />` component inside it.
   - Return the JSX from the `render()` method.
   - Export the **App** component as the default export.

**Expected Output:**

When the application is executed, it should display:

```
Books
--------------------------------
The Great Gatsby
Author: F. Scott Fitzgerald
--------------------------------
```

where the **Book** component is nested inside the **App** component.

**Note:**

- Both **App.jsx** and **Book.jsx** are in the same path.
- Initially, the page will show a placeholder until the required code is completed.

**Source Code:**

functionAndClassComponents/src/App.jsx

```
import { Component } from "react";
// Import the Book component here.
import Book from "./Book";
import ErrorBoundary from "./components/ErrorBoundary";

// Create the App class component here...
class App extends Component{
        render(){
                return (
                        <div>
                                <h3>Books</h3>
                                <div className="library">
                                        <Book />
                                </div>
                        </div>
                );
        }
}
export default App;
```

functionAndClassComponents/src/Book.jsx

```
// Create the Book function component here...
function Book(){
        return(
                <div className="book-card">
                        <h2>The Great Gatsby</h2>
                        <p>Author: F. Scott Fitzgerald</p>
                </div>
        );
}
export default Book;
```
